

Data Security and High Availability with Microsoft SQL Server

Today, no one can afford a system failure anymore. The availability of applications, systems and data is more important today than ever. At the same time, the increasing networking of business processes and the opening of IT systems to the outside world requires secure solutions for corporate data. Microsoft's SQL Server was developed as a database of the latest generation with the aim of meeting today's requirements for data management systems. By using SQL Server, users and IT experts alike benefit from minimized downtime, improved scalability and performance, and increased security. This „Consulting in a Box“ package helps you to make the best use of the new features for your company. Our Microsoft certified database consultants analyze your SQL Server systems for weaknesses and unused features. They clarify possibilities to secure data or guarantee uninterrupted operation through redundant data storage. We document the current status and draw up optimization proposals, which we discuss with you to show you how you can operate your database infrastructure even more fail-safe in future. Benefit from our experience as a Microsoft Gold Certified Partner.

Ihr Nutzen

- » **Transparency** – You receive an analysis of your current SQL Server databases from the point of view of failover strategies.
- » **Planning reliability** – We discuss data protection concepts with you and inform you about the project scope and procedure.
- » **Experience** – You work with consultants from a Microsoft Gold Certified Partner with a lot of practical knowledge from database projects.
- » **Know-how transfer** – We discuss alternatives with you and answer your questions about high availability and data security.
- » **Individual** – You receive transparent documentation as a reliable basis for planning further project steps.

Introduction Microsoft SharePoint 2013/2016

Objective

- » Support for companies in data security and high availability decisions
- » Transparency in the backup issue: Online backup concepts
- » Clarity for high availability analysis: Windows Cluster – database mirroring – log shipping – peer-to-peer replication
- » Availability analysis for a failure data center: location – parallel operation – time shift
- » Reduction of the administration effort through optimal maintenance planning
- » Development of clear recommendations for action

Our services

- » Analysis of the initial situation with regard to data security and high availability
- » Documentation and evaluation of the as-is analysis
- » Development and evaluation of backup/high availability concepts
- » Development of a rough concept
- » Discussion and final recommendation
